You will notice that the cams have 5 positions that allow for draw length adjustments in 1/4" increments. Example if you have the module set in the middle position, you have two positions longer and two positions shorter in 1/4" increments.

The difference between the high let off and lower let off is in the length of the cables. The lower let off has about 3/16" longer cables. You can also use larger or smaller O-rings to change the feel of the wall.
